ABSTRACT

A candidate for qualification as Submarine Medical Officer is required to conduct an independent research project in operational submarine medicine. This work is then submitted to the Naval Undersea Medical Institute in the form of a thesis. Several interesting and worthwhile projects have been completed under this program. Unfortunately, the information contained in these theses has not been widely disseminated. To increase the circulation of this information, a Key-Work-In-Context (KWIC) index system was developed. The Submarine Medical Qualification Theses written since 1944, with the exception of those that were classified, have been included in this index. It is hoped that the general circulation of this index will make researchers aware of this important body of information.

INTRODUCTION

The body of information contained in this Index of Submarine Medical Officer's Qualification Theses 1944-1974, from the Naval Undersea Medical Institute (NUMI), has not been accessible in the past. To make this information more accessible to the submarine and diving community, the authors have compiled this index by use of the computerized Key-Word-In Context (KWIC) system previously developed at the U.S. Navy Experimental Diving Unit.

The KWIC Index System

There are three sections to this KWIC index. Section I provides the user with a bibliographic listing of all of the NUMI theses. Each bibliographic entry has a unique eight-digit file number which serves to link the same reference in all three sections of this index. The first four digits represent the year completed; the remaining four digits represent the thesis number for that year. When the first four digits of a file number are zeros, the year of completion is not known. The bibliographic listing includes the authors, the complete title, the date, and where the thesis is available (i.e. NUMI).

Section II of the index consists of an author cross-reference. Thesis authors listed in Section I are cross-referenced in Section II. Each author in Section II is listed with the file number assigned to the thesis he has written.

Section III of the index lists each thesis by the major words that appear in the title. If there are five significant words in the title, the thesis will be listed five times in this section. In this Key-Word-In-Context (KWIC) index system each keyword is "framed" with the other words in the title that surround it. One

could be said to be looking at the keyword through a window that is 60 characters wide. Presenting the keywords in this fashion is necessary because oftentimes words derive their meaning from the context in which they are used. If each word had its own precise meaning, this type of presentation would not be necessary.

First reactions to the KWIC index are usually negative because the first impression is one of poor readability. This is due, in part, to the limitation of type face and also to the somewhat mangled appearance of the index line. Synonyms also appear to present minor problems. The importance of these objections wane, however, with continued use of the KWIC index, and the real value of the total system soon becomes evident to the user.

In the event that the keyword appears near the beginning or end of the title, the words surrounding the keyword are chosen using a wrap-around technique which preserves the context of the keyword. With this wrap-around method, the end of the title is reproduced to the left of a keyword that begins a title; the beginning of the title is reproduced to the right of a keyword that ends a title. For titles that have more than 60 characters, a plus sign is inserted in the KWIC listing to indicate the portion of the title that has been deleted. An equal sign is used to indicate the end of the title. Access to complete bibliographic information may be gained by cross-referencing back to Section I of the index using the eight-digit file number.

For effective use of KWIC indexes, the user should be aware of their special characteristics and should have an appreciation of the essential differences between these indexes and subject-heading indexes. Moreover, the user must realize there is a need to look

for synonyms of the words that most precisely describe the subject for which he is searching. Also, the user may need to look from the specific to the general when using KWIC rather than from the general to the specific, as is the case when using a subject-heading index. Finally, the user must be aware of terms used in relationship to the subject, even though those terms are not in hierarchial relationship to each other. Consequently, the ease with which a narrow subject may be located in the KWIC indexes should not detract the user from other possible leads to relevant bits of information.

SECTION I

Bibliographic Listing

NOTE: To find a thesis on a given topic, refer to Section III, the KWIC Index.

SECTION III

Key-Word-In-Context (KWIC) Listing

*REMINDERS to Users of KWIC Listing:

1. Keywords are centered in the page.
2. Because only 60 characters of a title are printed:

A plus sign (+) indicates the portion of the title that has been deleted;

An equal sign (=) indicates the end of a title.

3. To obtain complete bibliographic information of a thesis located in the KWIC Listing, cross-reference back to Section I, using the eight-digit file number following the title.

*

A full description of the system is provided on pages 1-3.

20. ABSTRACT (Continue on reverse side if necessary and identify by block number) A candidate for qualification as Submarine Medical Officer is required to conduct an independent research project in operational submarine medicine. This work is then submitted to the Naval Undersea Medical Institute in the form of a thesis. Several interesting and worthwhile projects have been completed under this program. Unfortunately, the information contained in these theses has not been widely disseminated. To increase the circulation of this information, a Key-Word-In-Context (KWIC)
